

ARTIFICIAL INTELLIGENCE SNIPPETS

THE NEED FOR ARTIFICIAL INTELLIGENCE

Why do we even need artificial intelligence?

- This question would have definitely arisen in your minds by now.
- Well, humans are a lazy species. We would love to live in a world where there is minimal human labor and thus we are able to save ample amounts of time.

- Also, the data we are producing is in huge chunks. We as humans need something that processes and handles data to minimize the strenuous efforts being put into handling it.
- This processing and handling of data is called data science. Data Science, in simple words, is the scientific study of data, that stores, records and analyses data for our benefit.

So basically, an artificially intelligent system perceives its environment in a manner that helps its analytical self in maximizing its chances of success. John McCarthy coined the term in 1956 and was defined as the science and engineering of making intelligent machines. It emphasizes on developing machines to think and work just like humans.
